This invention describes a method for conferring disease resistance in plants. The invention describes the use of novel genes and proteins belonging to the Oryza longistaminata and Oryza sativa receptor kinase-like protein (RRK) Xa21 multigene family. Such genes from cassava, maize and tomato are also described. The genes and proteins ca be used for enhancing resistance to Xanthomonas in a plant, preferably rice or tomato.

                                                                                                                                                                                                                                                                                                                                                                                                Increasing plant pathogen resistance by induction of varisgation—may lead to acquired resistance to a broad range of pathogens.

Claim 9; Page 85-87; 131p; Engilsh.

T06307 is a tomato pathogen resistance gene Cf-2.2 partial cDNA clone. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.2 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosportum fulvum.

C.fulvum contains avirulence (Avr) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

Claim 9; Page 80-83; 131pp; English.

706306 is the tomato pathogen resistance gene Cf-2.1. In a new method this gene is expressed highly in genetic constructs which may be used to impart a broad range of pathogen resistance, by induction of variegation, to transgenic plants (or parts or propagules of plants) containing such constructs. Cf-2.1 imparts resistance to the disease caused by the leaf mould fungal pathogen Cladosporium fulvum. C.fulvum contains avirulence (Avr.) genes that confer recognition by plants containing Cf-genes, leading to the activation of host defence mechanisms to attack the disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Š
production of apomictic seeds - useful in plant breeding claim 26; Pages 64-67; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide sequence encoding a protein which in active form in a cell or cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant material and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant, Apomixis provides for true-breeding, seed propagated hybrids and could shorten and simplify the breeding

Apomixis allows plant breeders to develop cultivars with specific stable traits for such characteristics as height, seed and forage quality and maturity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Production of apomictic seeds - useful in plant breeding Claim 21; pages 40-46; 123pp; English.

The sequence is that encoding SERK, a putative receptor kinase. It may be used as part of a method of producing apomictic seeds comprising: (a) transforming plant material with a nucleotide comprising: (a) transforming plant material with a nucleotide cell membrane renders the cell embryogenic; (b) regenerating the transformed material into plants or carpel-containing plant parts; and (c) expressing the sequence in the vicinity of the embryo sac. The apomictic seeds and embryos thus produced can be developed into plant progeny. This is useful in plant to breeding programs. Controllable and reproducible apomixis provides many advantages in plant improvement and cultivar development in the case that sexual plants are available as crosses with the apomictic plant. Apomixis provides for true-breeding, seed process so that selfing and progeny testing to produce and/or stabilise a desirable gene combination could be eliminated. Apomixis allows plant breeders to develop cultivars with seed in the could stable traits for such characteristics as height, seed and forage quality and maturity.

Tomato gene Cf.5, confers resistance to Cladosporium fulvum - useful for production of transgenic plants resistant to pathogens e.g. tomato leaf mould C. fulvum in tomatoes

Claim 6; Fig 1b; 75pp; English.

This sequence is an example of the polynucleotide of the invention, is able to confer pathogen resistance on a plant. It is one of two to CF-5 gene variants, which offer resistance against the pathogen Cladosporium fulvum-5. Transgenic plants can be produced by incorpor the gene into plant cells and regenerating plants from the cells; assexually or sexually produced offspring can also be subsequently produced. Expression of the gene in plant cells can confer pathogen
                                                                                                                                                                                                                                                                                                                                                                                                                         CF-5 pathogen resistance gene variant #2.

Expression of the gene in plant cells can confer pathogen resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. Oligonucleotides with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/polynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and Cf-9 may be used to identify further resistance genes of this class. Sequence 3979 BP; 1217 A; 717 C; 698 G; 1347 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            resistance on a plant e.g. to tomato leaf mould (C. fulvum) in tomatoes. Oligonucleotides with sequences complementary to the gene or fragments of it, are useful in anti-sense techniques to reduce gene expression. The nucleic acids/folynucleotides are useful as hybridisation probes to identify other genes/fragments conferring pathogen resistance on plants e.g. Phytophthora resistance in potatoes. Homologies between Cf-5 and Cf-9 may be used to identify further resistance genes of this class. Sequence 3979 BP; 1218 A; 716 C; 698 G; 1347 T;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                            /notes vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; /notes vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; /Lambda PRL2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) 7 day germinated eticlated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark- rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The cDNA inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "

/lambda PRL2 is a cDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark- rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
oligo dT primed cDNA.

Lambda-PRL2
                                               Inote-"Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not; Lambda PRI2 is a cDNA library derived from equal quantities of 4 pools of mRNA. The mRNA sources were 1) day germinated etiolated seedlings; 2) tissue culture grown roots; 3) staged plants half with 24 hour light cycle, half on 16 hr light, 8 hour dark-rosettes; 4) same plants as 3 but aerial tissue (stems, flowers and siliques. The vector is BRL's lambda Zip-Lox. The CDNA stages are plants as 3 but aerial tissue (stems).
inserts were directionally cloned with Sal-Not arms using oligo dT primed cDNA. "

Lambda PRL2 is a CDNA library derived from equal
quantities of 4 pools of mRNA. The mRNA sources were
day germinated etiolated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark- rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and

Madigan Building,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 University of Illinois
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     190
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              'Note-"vector: pBluescript II XR; Site_1: EcoRI Site_2: XhoI; Library Gm:r1021 is a sequence-friven, reracked set of the original library Gm-c1004 which was prepared from root cDNA. The mRNA was isolated from entire roots of day old 'Williams' seedlings which were propagated on paper towels with distilled water. Stratagene's cDNA synthesis Wit (catalog #200401) was used to Synthesize the cDNA. The Gm-c1004 library was constructed by Dr. Paul Keim & Virginia H. Coryell, Department of Biology, BOX5640, Northern Arizona University, Flagstaff, AZ BOX15640, Northern Arizona University, Flagstaff, AZ BOX15640; Northern Arizona University, Flagstaff, AZ
